

A. Design Your Database

Before creating your database, plan the structure based on your client site. You must:

- ☐ Identify **at least TWO tables** relevant to your client site.

Users and Templates

- ☐ Determine what data each table will store.

Users will store email, usernames, and passwords for logins

Templates will store each template for different style projects

- ☐ Identify how the tables will be related (i.e., primary key, foreign key).

The Users and Templates tables will be related because each template is created by a user. One user can create many templates, and each template is linked to a user using a foreign key.

1. For each table, include:

- The purpose of the table
 - The purpose of the users table is to save user login information on the Thinktree website
- What data it stores
 - Email, Username, Password
- How it supports your client site
 - Allows users to log in and manage their projects and ensures each user has a unique identity.
- How it relates to other table(s)
 - Each user can create multiple templates.

2. For each table, clearly document:

- Column names
 - User_id, username, email, password
- Data types
 - Integer, character, character, character
- Primary key
 - The primary key is the User_id column
- Foreign key(s) (if applicable)
 - No for Foreign key

3. Include screenshots from phpMyAdmin for each table showing:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
☐ 1	<u>Username</u>	varchar(10)	utf8_unicode_ci		No	None	Stores username		Change Drop More
☐ 2	<u>Email</u>	varchar(10)	utf8_unicode_ci		No	None	Stores User email		Change Drop More
☐ 3	<u>Password</u>	varchar(10)	utf8_unicode_ci		No	None	Stores user password		Change Drop More
☐ 4	<u>User_id</u>	int(100)			No	None	Row identifier		Change Drop More

4. For each table, include:

- The purpose of the table
 - The purpose of the Template table is to store different starting templates users can use for their projects
- What data it stores
 - It stores descriptions and titles along with specific id's
- How it supports your client site
 - Provides a structure for users coding projects
- How it relates to other table(s)
 - Stores data incremented with a foreign key

5. For each table, clearly document:

- Column names
 - Temp_id, title, description
- Data types
 - Integer, character, character,
- Primary key
 - The primary key is the tree_id
- Foreign key(s) (if applicable)
 - No Foreign key

6. Include screenshots from phpMyAdmin for each table showing:

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
☐ 1	<u>Temp_id</u> 	int(100)			No	None	Row identifier		 Change  Drop  More
☐ 2	<u>Title</u>	varchar(10)	utf8_unicode_ci		No	None	Title of template		 Change  Drop  More
☐ 3	<u>Description</u>	varchar(10)	utf8_unicode_ci		No	None	Description of template		 Change  Drop  More
